CAMS WEEKLY REPORT

26 November - 2 December 1977

1. CAMS production data base was successfully reallocated last weekend. The results were so successful in reducing I/O contention that the CAMPROD, GIM-II job is running 30% more transactions each day; however, CAMPROD is consistently using 94-99% of the CPU, causing problems getting enough resources to run batch jobs. Production personnel are helping us find some solution to the batch problem.

STATINTL

CAMS Project Manager
